Dear Hiring Team at Cadeler,

I trained as an architect, and what progressively drew me beyond the drawings were the questions a design studio rarely stops on - why something is being built, whether it should be built there at all, and what its impact will be over its life. Following those questions took me to a Master's Degree in Architecture Computation at The Royal Danish Academy and, within it, specifically toward data, which is the part that makes it possible to answer them with evidence instead of intuition, and from there into sustainability and responsible business consulting. Cadeler is where those questions become commercial, since a company that installs and services offshore wind farms reads auction rounds, seabed leasing and government targets years before a vessel is contracted.

During my time in Ramboll Management Consulting's Responsible Business Conduct team I ran human rights due diligence for corporate clients under the UN Guiding Principles and the OECD Guidelines, and in practice a large part of that was data work. I built a fully automated risk assessment system in Excel that consolidated supply chain risk data into a single dashboard which updated salient risks dynamically, an impact assessment tool that scored more than forty risks by severity so the most material ones surfaced first, and a mapping of the supply chains of over twenty critical raw materials under the EU Critical Raw Materials Act. The common task underneath all of it was taking broad and uneven bodies of evidence and structuring them rigorously enough to produce scored, defensible outputs. That structuring task is the substance of this role, because auction results, leasing rounds and competitor movements arrive scattered across sources long before they read as a pipeline.

My work at Sweco extended into the commercial side of the practice, where I wrote the technical and methodology sections of competitive international tenders, assembled bid teams around the specialist expertise each procurement required, and built a pricing tool that parametrised expert fee bands and project economics so that bid decisions rested on figures rather than on judgement alone. Alongside that I joined field missions across Baku's water supply system, where I sat with national water agencies and government counterparts to align on rehabilitation priorities and gather the technical data the project needed. That combination taught me how a consultancy actually wins and then delivers work, and how much of it depends on being precise with people who are not obliged to agree with you. This role runs on the same pairing, where intelligence gathered across the industry is only worth having once it is recorded to a standard a commercial decision can rest on.

Cadeler owns and operates the vessels that build and maintain offshore wind farms, which obliges it to hold a view of the market well ahead of the projects it will serve. That is where I want to keep doing the work I find most worthwhile, which is turning large and awkward bodies of data into something a business can decide on.

Best,

Antonio Carmagnani
