Dear Hiring Team at Deloitte,

I trained as an architect, and the interest that has run alongside that from the beginning is data - using it to understand what has been built and what could be built better. That is what took me from architecture practice into feasibility and analysis, and then to a Master's in Architecture Computation at The Royal Danish Academy, a programme built around using data and technology to improve the decisions made in real estate and construction. The through line has been consistent, which is that I would rather build the analytical tool that answers a question than argue the question without one. What makes the role interesting to me is that Deloitte's HR Strategy and Technology practice sits inside Technology and Transformation rather than beside it, treating the operating model and the systems that carry it as one problem.

During my time in Ramboll Management Consulting's Responsible Business Conduct team I ran human rights due diligence for corporate clients under the UN Guiding Principles and the OECD Guidelines, and in practice a large part of that was data work. I built a fully automated risk assessment system in Excel that consolidated supply chain risk data into a single dashboard which updated salient risks dynamically, an impact assessment tool that scored more than forty risks by severity so the most material ones surfaced first, and a mapping of the supply chains of over twenty critical raw materials under the EU Critical Raw Materials Act. The common task underneath all of it was taking broad and uneven bodies of evidence and structuring them rigorously enough to produce scored, defensible outputs. Diagnosing how an organisation works and where it is exposed is that same exercise on a different subject, and this role puts it at the centre of what an analyst produces.

At Isay Weinfeld Architects I wrote a Grasshopper plugin in Python that generates bespoke staircases directly from a floor plan, which took a task that had run to several days down to roughly twenty minutes and made a far wider range of geometry testable within a project timeline. Building it was the smaller half of the work - the rest was sitting with the colleagues who had been doing it by hand to establish what they actually needed, presenting the tool in a studio workshop, and supporting its adoption across more than ten projects afterwards, which taught me that a tool nobody trusts enough to use has not been finished. That is the part of any technology implementation that decides whether it improves how a function operates or merely exists alongside it, which is why I would rather work where the advice and the system are owned by the same team.

Deloitte is the largest consultancy in Denmark and runs these engagements end to end for multinational clients. That is where I want to keep doing the work I find most worthwhile, which is turning large and awkward bodies of data into something a business can decide on.

Best,

Antonio Carmagnani
