Sobre

I'm a Data Analyst and Software Developer who gets excited about one thing above all: making complex systems simpler for the people who use them.

By day, I work as a Data Analyst at Airbus, where I build the data infrastructure, dashboards, and automation tools that help analysts and product managers make strategic decisions across a multi-billion euro portfolio. My stack centers on SQL, Python and BI Tools — but what I actually care about is the moment a dense dataset becomes a clear decision for a senior stakeholder.

On the side, I build bespoke plugins and automation tools for AEC firms, helping designers and engineers reclaim hours of manual work through custom Stand-alone, Rhino and Revit tooling.

Whether it's a pricing pipeline at scale or a niche plugin for an award-winning studio, the through-line is the same: I find the bottleneck, build the solution, and make it disappear into the workflow.

Based in Copenhagen.

Data Analyst

Tempo integral

jul de 2024 - o momento · 2 anos 2 meses

Copenhagen, Região da Capital, Dinamarca · No local

Restructured team ways of working by mapping operational processes, then simplifying and automating them — reducing team operational workload in certain tasks from ~24 hrs/week to near zero.

Designed and deployed an automated a commercial offer workflow in Python, pioneering the documentation of our pricing strategy across a million-part portfolio and increasing customer satisfaction.

Surveyed needs and developed the departments' data infrastructure, including SQL data pipelines connecting SAP systems to big data tools, BI dashboards used by leadership and analysts, automated workflows, and digested datasets that enabled non-technical stakeholders to also perform analysis.

Led several strategic pricing analysis covering years of historical sales data (4B+ USD/year across 3M+ parts) to evaluate the financial impact of changes in the policy and uncover business opportunities; collaborating with product managers to increase revenue and customer satisfaction.

Strategic Design and Entrepreneurship, Computational Design

set de 2022 - jun de 2024

Developed research in computer vision, data analytics and machine learning.

Identifying informal settlements with ML and time-series satellite images - Author
In the context of the Venezuelan refugee crisis, a CNN-based segmentation model was trained to identify

the location and scale of emerging informal settlements in underdeveloped South American countries. This enables local authorities and NGOs to more accurately devise public policies through previously inaccessible data.

Sitely - Master Thesis / Startup

Sitely is a web-based tool that bridges the gap between land developers, architects and building authorities through holistic data modelling of building sites. It delivers insights into the environmental, social, and financial potential of real estate projects, enabling faster research cycles and more informed negotiations for all stakeholders. Sitely was privately acquired.
